

II - Series

Sequence $\{a_n\} : a_1, a_2, a_3, \dots$

Series $\sum_{n=1}^{\infty} a_n = a_1 + a_2 + a_3 + \dots$

↳ the sum of the terms of a sequence

Question: How to add ∞ -many terms?

Strategy: partial sums ① $S_n = a_1 + a_2 + \dots + a_n$ (finite)

② let $n \rightarrow \infty$ $\lim_{n \rightarrow \infty} S_n$

$\{S_n\}$ a sequence

Sequence $\{a_n\} : a_1, a_2, a_3, \dots \leftarrow$ full sum = S_∞

Series $\sum_{n=1}^{\infty} a_n = a_1 + a_2 + a_3 + \dots$

Series = adding up elements of a sequence

associated sequences: $\{a_n\} \leftarrow$ terms that are being added

$\{S_n\} \leftarrow$ sequence of partial sums

$$\begin{aligned} S_n &= n^{\text{th}} \text{ partial sum} \\ &= a_1 + a_2 + \dots + a_n \\ &= \sum_{i=1}^n a_i \end{aligned}$$

Define: $\sum_{n=1}^{\infty} a_n = \boxed{\lim_{n \rightarrow \infty} S_n} = S_{\infty}$

• add up n terms
• let $n \rightarrow \infty$

Major Problem: To take $\lim_{n \rightarrow \infty} S_n$, we need the formula for

S_n (not given; only a_n 's are given).

Finding a formula for S_n is sometimes difficult,

and often impossible.

Big Picture: Given $\sum_{n=1}^{\infty} a_n$,

is a formula for S_n findable?

NO YES

Pass/Fail Tests

But, value of sum remains unknown

- e.g. integral test
 - p-series
 - comparison \sim direct
 - ratio
 - root $\sqrt[n]{a_n}$ test (test for divergence)
 - other: alternating series tests
 - absolute convergence
- all required terms

$$\lim_{n \rightarrow \infty} S_n \quad \text{Done.}$$

A value can be found

e.g. telescoping, geometric

Def'n:

$$\sum_{n=1}^{\infty} a_n = \lim_{n \rightarrow \infty} S_n = S_{\infty}$$

If the $\lim_{n \rightarrow \infty} S_n$ exists, we say $\sum_{n=1}^{\infty} a_n$ converges to the limit value.

Otherwise, $\sum_{n=1}^{\infty} a_n$ diverges.

e.g. ① $\sum_{n=1}^{\infty} \frac{1}{n^2+n}$

a) Find $a_3, a_4, S_1, S_2, S_3, S_4$

$$a_3 = \frac{1}{3^2+3} = \frac{1}{12}$$

$$a_4 = \frac{1}{16+4} = \frac{1}{20}$$

$$S_1 = a_1 = \frac{1}{2}$$

$$S_2 = a_1 + a_2 = \frac{1}{2} + \frac{1}{6} = \frac{1}{2}$$

$$S_3 = a_1 + a_2 + a_3$$

$$= \frac{1}{2} + \frac{1}{6} + \frac{1}{12} + \frac{1}{20}$$

$$= \frac{3}{4}$$

$$S_4 = a_1 + a_2 + a_3 + a_4$$

$$= \frac{4}{5}$$

$$\{S_n\} = \frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \dots$$

$$\text{guess? } S_n = \frac{n}{n+1}$$

b) Does $\sum_{n=1}^{\infty} \frac{1}{n^2+n}$ converge? If so, find its value.

$$\sum_{n=1}^{\infty} a_n = \lim_{n \rightarrow \infty} \frac{n}{n+1} = 1$$

If our guess is correct, $\sum_{n=1}^{\infty} \frac{1}{n^2+n}$ converges to 1

d) Prove that this is right.

Notice: $\frac{1}{n^2+n} = \frac{1}{n(n+1)} = \frac{A}{n} + \frac{B}{n+1}$ partial fraction

$$1 = A(n+1) + B(n)$$

Magic Values Method

$$n=0: 1 = A$$

$$n=-1: 1 = -B$$

$$B = -1$$

System of Eq Method

$$1 = (A+B)n + A$$

$$n^1: \left\{ \begin{array}{l} 0 = A + B \\ 1 = A + B \end{array} \right.$$

$$n^0: \left\{ \begin{array}{l} 1 = A \\ 1 = A \end{array} \right.$$

$$\text{So, } \sum_{n=1}^{\infty} \frac{1}{n^2+n} = \sum_{n=1}^{\infty} \left(\frac{1}{n} - \frac{1}{n+1} \right)$$

$$\therefore S_n = a_1 + a_2 + a_3 + \dots + a_n$$

$$= \left(1 - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) + \dots + \left(\frac{1}{n} - \frac{1}{n+1}\right)$$

$$= 1 - \frac{1}{n+1} = \frac{n}{n+1} \quad \checkmark$$

\therefore Our guess was right.

ex. For you

① Consider $\sum_{n=1}^{\infty} a_n$ where a_n is unknown.

You are told however that $S_n = \frac{n-1}{2n+3}$

a) Does $\sum_{n=1}^{\infty} a_n$ converge? If so, find its value.

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \frac{n-1}{2n+3} = \lim_{n \rightarrow \infty} \frac{n(1-\frac{1}{n})}{n(2+\frac{3}{n})} = \frac{1}{2} \quad \checkmark$$

$$\text{b) } a_n = S_n - S_{n-1}$$

$$= \frac{n-1}{2n+3} - \frac{(n-1)-1}{2(n-1)+3}$$

$$= \frac{n-1}{2n+3} - \frac{n-2}{2n+2}$$

(2) Examine the following for convergence. If they converge, find their values.

$$\text{a)} \sum_{n=1}^{\infty} \frac{1}{n^2 + 4n + 3} = S_{\infty}$$

$$\frac{1}{n^2 + 4n + 3} = \frac{1}{(n+1)(n+3)} = \frac{A}{n+1} + \frac{B}{n+3}$$

$$1 = A(n+3) + B(n+1)$$

$$n = -3: 1 = -2B$$

$$B = -\frac{1}{2}$$

$$n = -1: 1 = 2A$$

$$A = \frac{1}{2}$$

$$S_{\infty} = \sum_{n=1}^{\infty} \left(\frac{1}{n+1} - \frac{1}{n+3} \right) \cdot \frac{1}{2}$$

$$S_n = \frac{1}{2} \cdot \left[\left(\frac{1}{2} - \frac{1}{4} \right) + \left(\frac{1}{3} - \frac{1}{5} \right) + \left(\frac{1}{4} - \frac{1}{6} \right) + \dots + \left(\frac{1}{n} - \frac{1}{n+2} \right) + \left(\frac{1}{n+1} - \frac{1}{n+3} \right) \right]$$

$$= \frac{1}{2} \left(\frac{1}{2} + \frac{1}{3} - \frac{1}{n+2} + \frac{1}{n+3} \right)$$

$$S_{\infty} = \lim_{n \rightarrow \infty} S_n = \frac{1}{2} \left(\frac{1}{2} + \frac{1}{3} \right) \\ = \frac{5}{12} \quad \frac{3}{6} + \frac{2}{6} = \frac{5}{6} \cdot \frac{1}{2} = \frac{5}{12}$$

$$\text{b)} \sum_{n=1}^{\infty} \ln \left(1 + \frac{1}{n} \right)$$

$$\ln \left(1 + \frac{1}{n} \right)$$

$$= \ln \left(\frac{n+1}{n} \right)$$

$$= \ln \left((n+1) \cdot \frac{1}{n} \right)$$

$$= \ln(n+1) + \ln\left(\frac{1}{n}\right)$$

$$= \ln(n+1) - \ln(n)$$

$$S_n = (\cancel{\ln(2)} - \ln(1)) + (\cancel{\ln(3)} - \cancel{\ln(2)}) + (\cancel{\ln(4)} - \cancel{\ln(3)})$$

$$\therefore = (\ln(n+1) - \cancel{\ln(n)})$$

$$S_n = \ln(n+1) - \ln(1)$$

$$\lim_{n \rightarrow \infty} S_n = \ln(\infty) - 0 = \infty \quad \therefore \text{The series does not converge.}$$

Geometric Series

geometric sequence: $\{ ar^{n-1} \} = a, ar, ar^2, ar^3, \dots$

geometric series: $\sum_{n=1}^{\infty} ar^{n-1} = a + ar + ar^2 + ur^3 + \dots$

$a = 1^{\text{st}}$ term

$r = \text{ratio of subsequent terms}$

$$\frac{a_{n+1}}{a_n} = r$$

$$\sum_{n=1}^{\infty} ar^{n-1} = \begin{cases} \frac{a}{1-r} & |r| < 1 \\ \text{diverges} & |r| \geq 1 \end{cases}$$

ex.

1 unit or see for any size
square that a third of
the squares are covered.

$$\frac{1}{4} + \frac{1}{16} + \frac{1}{64} + \dots$$

geometric

$$a = \frac{1}{4}$$

$$r = \frac{1}{4}$$

$$\frac{\frac{1}{4}}{1 - \frac{1}{4}} = \frac{\frac{1}{4}}{\frac{3}{4}} = \frac{1}{3}$$

2. Parastu receives \$25 each year on her birthday from when she is 5 years old to when she is 20 years old. Each year she deposits the money and leaves it in the bank at 2% interest compounded yearly. How much money does she have on her 20th birthday?

Feb. 12

Finite geometric series.

time

$$\sum_{i=0}^{15} 25(1.02)^i$$

$$S_{16} = 25 + 25(1.02) + \dots + 25(1.02)^{15}$$

$$S_{16} = \frac{A(1 - R^n)}{1 - R} = \frac{25(1 - 1.02^{16})}{1 - 1.02}$$

Geometric series & Power Series

→ ex. Taylor series are power series

A power series is a series of the form

$$\sum_{n=0}^{\infty} C_n x^n \quad \text{or} \quad \sum_{n=0}^{\infty} C_n (x-a)^n$$

↑ center at 0 ↑ centered at a

where C_i 's are coefficients and x is a variable.

So, the power series is really a function

$$f(x) = \sum_{n=0}^{\infty} C_n (x-a)^n$$

The domain of $f(x)$ is the set of x values for which the series converges.

Similarly, we can build series out of other functions.

$$f(x) = \sum_{n=0}^{\infty} c_n (g(x))^n$$

Ex. $\sum_{n=0}^{\infty} x^n = 1 + x + x^2 + x^3 + \dots$ expanded or series form

geometric series

$$a = 1$$

$$r = x$$

domain \rightarrow interval of convergence

$$|r| = |x| < 1 \Rightarrow -1 < x < 1$$

or $x \in (-1, 1)$

Find a closed-form formula

$$f(x) = \frac{a}{1-r} = \frac{1}{1-x} \text{ when it converges}$$

ex. $f(x) = \frac{1}{2-x}$; express as a series

note: asymptote

$$f(x) = \frac{1}{2-x} = \frac{1}{1-(x-1)} \Rightarrow a=1, r=x-1$$

*different spelling
of same fun*

$$f(x) = \sum_{n=0}^{\infty} (x-1)^n$$

valid for $|x-1| < 1$

$$-1 < x-1 < 1$$

$$0 < x < 2$$

$$x \in (0, 2)$$

3. Use a geometric series to express each of the following functions as a power series at the given centre.
Give its interval of convergence.

a) $f(x) = \frac{1}{x+3}$, centered at 0 (in powers of x)

$$f(x) = \frac{1}{x+3} = \frac{y_3}{1+\frac{x}{3}} = \frac{y_3}{1-(-\frac{x}{3})}$$

$$f(x) = \sum_{n=0}^{\infty} \frac{1}{3} \left(-\frac{x}{3}\right)^n \quad \text{valid for } \left| -\frac{x}{3} \right| < 1$$

$$= \sum_{n=0}^{\infty} \frac{(-1)^n x^n}{3^{n+1}}$$

$$-1 < \frac{x}{3} < 1$$

$$-3 < x < 3$$

$$x \in (-3, 3)$$

b) $g(x) = \frac{2x^2}{1 + 8x^3}$, centered at 0

$$g(x) = \frac{2x^2}{1 + 8x^3}$$

$$g(x) = \frac{2x^2}{1 - (-8x^3)}$$

$$g(x) = \sum_{n=0}^{\infty} 2x^2(-8x^3)^n \quad \text{valid for } |-8x^3| < 1$$

$$-1 < 8x^3 < 1$$

$$-\frac{1}{8} < x^3 < \frac{1}{8}$$

$$-\frac{1}{2} < x < \frac{1}{2}$$

$$x \in \left(-\frac{1}{2}, \frac{1}{2}\right)$$

c) $h(x) = \frac{1}{x^2 - 6x + 10}$, centered at 3 (in powers of $(x - 3)$)

$$h(x) = \frac{1}{1 - (-x^2 + 6x - 9)}$$

$$= \sum_{n=0}^{\infty} (-x^2 + 6x - 9)^n \quad \text{valid for } |-x^2 + 6x - 9| < 1$$

$$\left|- (x-3)^2\right| < 1$$

$$(x-3)^2 < 1$$

$$-1 < x - 3 < 1$$

$$2 < x < 4$$

$$x \in (2, 4)$$

d) $j(x) = \frac{1}{2x+3}$, centered at 1 (in powers of $(x-1)$). HINT: Let $t = x-1$, so $x = t+1$

$$\text{Let } t = x-1 \Rightarrow x = t+1$$

$$j(t) = \frac{1}{2(t+1)+3}$$

$$= \frac{1}{2t+5}$$

$$= \frac{\gamma_s}{1 - (-\frac{t}{2})}$$

$$j(x) = \frac{\gamma_s}{1 - \left(-\frac{x-1}{2}\right)}$$

$$= \sum_{n=0}^{\infty} \frac{1}{5} \left(-\frac{x-1}{2}\right)^n \quad \text{valid for } \left|-\frac{x-1}{2}\right| < 1$$

$$-1 < \frac{x-1}{2} < 1$$

$$-2 < x-1 < 2$$

$$-1 < x < 3$$

$$x \in (-1, 3)$$

Contrapositive

A

B

→ If it's raining, then there are clouds in the sky

I) If there are clouds, then it's raining

II) If it's not raining, then there are no clouds

→ III) If there are no clouds, then it's not raining

Statement: If A, then B

contrapositive: if not B, then not A Switched order and
made them negative

A statement and its contrapositive are equivalent

Recall: n^{th} term test

If $\lim_{n \rightarrow \infty} a_n \geq 0$, then $\sum_{n=1}^{\infty} a_n$ diverges.

Contrapositive: If $\sum_{n=1}^{\infty} a_n$ converges, then $\lim_{n \rightarrow \infty} a_n = 0$
↑ proof

Feb. 14

n^{th} -term Test (Test for Divergence)

If $\sum a_n$ is a series and if $\lim_{n \rightarrow \infty} a_n \neq 0$, then

$\sum a_n$ diverges.

Proof by contraposition: we will prove the contrapositive

If $\sum a_n$ converges, then $\lim_{n \rightarrow \infty} a_n = 0$

Pictorially:

Proof: If $\sum a_n$ converges,

then $\lim_{n \rightarrow \infty} S_n$ exists

$$\therefore \text{let } \lim_{n \rightarrow \infty} S_n = L \in \mathbb{R} \quad (L \neq \pm \infty)$$

Examine $S_n = S_{n-1} + a_n$

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} (S_{n-1} + a_n)$$

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} S_{n-1} + \lim_{n \rightarrow \infty} a_n$$

$$L = L + \lim_{n \rightarrow \infty} a_n$$

$$\therefore \lim_{n \rightarrow \infty} a_n = 0$$

Remarks: If $\lim_{n \rightarrow \infty} a_n = 0$, we can conclude nothing.

n^{th} -term test fails.

ex $\left\{ \begin{array}{l} \sum \frac{1}{n} = \text{Harmonic Series} = \infty \\ \sum \frac{1}{n^2} = \frac{\pi^2}{6} \text{ conv.} \end{array} \right\}$ p-series
from Cal II

n^{th} -term test

$$\lim_{n \rightarrow \infty} \frac{1}{n} = 0 \quad \text{but div}$$

$$\lim_{n \rightarrow \infty} \frac{1}{n^2} = 0 \quad \text{but conv}$$

ex. Apply n^{th} term test to

a) $\sum \frac{\sqrt{n}}{\ln n}$

$$\lim_{n \rightarrow \infty} \frac{\sqrt{n}}{\ln n} = \infty \quad (\text{growth}) \therefore \sum \frac{\sqrt{n}}{\ln n} \text{ div}$$

b) $\sum \frac{\ln n}{\sqrt{n}}$

$$\lim_{n \rightarrow \infty} \frac{\ln n}{\sqrt{n}} = 0 \quad (\text{growth}) \quad \therefore \text{we can conclude nothing}$$

c) $\sum \left(1 - \frac{2}{n}\right)^n$

$$\lim_{n \rightarrow \infty} \left(1 - \frac{2}{n}\right)^n = e^{-2} \neq 0 \quad \therefore \sum \left(1 - \frac{2}{n}\right)^n \text{ div}$$

$\therefore \left(1 + \frac{-2}{n}\right) = e^{-2}$

Integral Test

If $\sum a_n$ is a series and if $a_n = f(n)$ where

$f(x)$ is a continuous, decreasing, positive function,

then $\sum a_n$ & $\int_c^\infty f(x)dx$ either converge together or
not necessarily to the same value

$$\sum a_n \neq \int_c^\infty f(x)dx$$

Proof: Convergent Case

For ease of notation, let $c=1$.

Examine $\sum_{n=1}^{\infty} a_n$ & $\int_1^\infty f(x)dx$

We will show that $\{S_n\}$ is

- incr
- bounded above (it's already bounded below since it's increasing) (by 1st item)

(i) incr: Show that $S_n > S_{n-1}$

$$S_n - S_{n-1} > 0$$

$$a_n > 0$$

$$f(n) > 0 \text{ (positive)} \quad \checkmark$$

(ii) bounded above:

Let $\int_1^\infty f(x)dx = A$

by the picture clearly $a_2 + a_3 + \dots + a_n < A$

$$a_1 + a_2 + a_3 + \dots + a_n < a_1 + A$$

$$S_n < a_1 + A \quad \text{for any } n$$

$\therefore S_n$ is bounded above

\therefore By BMC $\lim_{n \rightarrow \infty} S_n$ exists

Since $\sum a_n = \lim_{n \rightarrow \infty} S_n$, the sum conv.

Ex. Apply the int. test to:

$$\textcircled{1} \quad \sum \frac{1}{n \ln n}$$

can't start at n=1

Let $f(x) = \frac{1}{x \ln x}$ on $x \geq 2$

- continuous: quotient of product of continuous functions \therefore continuous

- $x \geq 2$

$$\ln x \geq \ln 2 \geq 0 \quad \therefore \quad \frac{1}{x \ln x} > 0 \quad \text{for } x \geq 2$$

- $x, \ln x \uparrow$

$$x \cdot \ln x \uparrow$$

$$\frac{1}{x \cdot \ln x} \quad \downarrow$$

or show $f'(x) < 0$

Examine $\int_2^{\infty} \frac{1}{x \ln x} dx = \lim_{t \rightarrow \infty} \int_2^t \frac{1}{x \ln x} dx$

Let $u = \ln x$

$$du = \frac{1}{x} dx$$

$$\int_{\ln 2}^{\ln t} \frac{1}{u} du = \lim_{t \rightarrow \infty} [\ln |u|]_{\ln 2}^{\ln t}$$

$$= \lim_{t \rightarrow \infty} \left(\ln \left[\frac{\ln t}{\infty} \right] - \ln (\ln 2) \right)$$

$$= \infty \quad \therefore \sum \frac{1}{n \ln n} \text{ div}$$

② Apply the int. test

$$\sum n e^{-n}$$

$$\text{let } f(x) = x e^{-x} dx \quad \text{for } x \geq 1$$

• continuous: product of two cont's funcs

$$\cdot x \geq 1$$

$$x e^{-x} \geq 1 e^{-x} \geq 0$$

$$\cdot f(x) = \frac{x}{e^x}$$

Note:

$$f'(x) = \frac{e^x - x e^x}{e^{2x}}$$

$$= \frac{1}{e^x} - \frac{x}{e^x}$$

$$= \frac{1-x}{e^x} < 0 \text{ for } x > 1$$

Examine $I = \int x e^{-x} dx$

$$\begin{aligned} \text{Let } f &= x & g &= -e^{-x} \\ f' &= 1 & g' &= e^{-x} \end{aligned}$$

$$I = -x e^{-x} - \int_1^\infty -e^{-x} dx$$

$$= -x e^{-x} - e^{-x} + C$$

$$\therefore \int_1^\infty x e^{-x} dx = \lim_{t \rightarrow \infty} \left[-x e^{-x} - e^{-x} \right]_1^t$$

$$= \lim_{t \rightarrow \infty} \left[-\frac{t}{e^t} - \frac{1}{e^t} + \frac{2}{e} \right]$$

$$= 0 - 0 + \frac{2}{e}$$

$$= \frac{2}{e}$$

$\therefore \sum n e^{-n}$ conv. (to an unknown value)

Approximating Sums

Take one of the partial sums as an approx.

ex. $\sum_{n=1}^{\infty} n e^{-n} \approx S_3 = e^{-1} + 2e^{-2} + 3e^{-3}$

But how good an approx is this? What's the max error?

Remainder R (error)

$$\sum_{n=1}^{\infty} a_n = \underbrace{a_1 + a_2 + a_3 + \dots + a_n}_{S_n} + \underbrace{a_{n+1} + a_{n+2} + \dots}_{R}$$

for any n , R is the sum of the omitted terms

R is another series.

Feb 16

Integral test consequence: $\sum \frac{1}{n^p} \hookrightarrow \int_1^\infty \frac{1}{x^p} dx \begin{cases} \text{conv: } p > 1 \\ \text{div: } p \leq 1 \end{cases}$

Estimating Series Values & Error

Conv. $\sum a_n = \lim_{n \rightarrow \infty} S_n = S$

$$= \underbrace{a_1 + a_2 + a_3 + \dots + a_n}_{S_n} + \underbrace{a_{n+1} + a_{n+2} + \dots}_{\text{omitted: } R}$$

Strategy:

Pick a n -value

Use S_n as an estimate for S

Remainder
or error

Our goal will be to give a bound on R .

$$R = a_{n+1} + a_{n+2} + \dots$$

$$\text{or } S = S_n + R$$

$R = S - S_n \leftarrow$ for a series with positive terms

$$a_n > 0,$$

then $s - s_n > 0$

In general, the magnitude of the error is

$$R = |s - s_n|$$

Error in context of the integral test

Estimate the error by using s_n as an estimate for
 $s = \sum a_n$ $f(n) = a_n$

$$R = a_{n+1} + a_{n+2} + \dots$$

$$R < \int_n^{\infty} f(x) dx$$

Last day $\sum_{n=1}^{\infty} n e^{-n}$ conv by int-test

a) Estimate the value of this series by taking $n=4$ terms

b) Give a bound for the error in your estimate

$$\begin{aligned} a) S &= \sum_{n=1}^{\infty} n e^{-n} \approx S_4 = a_1 + a_2 + a_3 + a_4 \\ &= e^{-1} + 2e^{-2} + 3e^{-3} + 4e^{-4} \\ &\approx 0.8612 \end{aligned}$$

$$\begin{aligned} b) R &< \int_n^{\infty} f(x) dx \\ &< \int_4^{\infty} x e^{-x} dx = \lim_{t \rightarrow \infty} \left[-x e^{-x} - e^{-x} \right]_4^t \\ &= 5e^{-4} \\ &\approx 0.092 \end{aligned}$$

c) How many terms do we need for the error to be less than 10^{-3} .

$$R < \int_n^{\infty} f(x) dx < 10^{-3}$$

$$\int_{n}^{\infty} x e^{-x} dx < 0.001$$

from maple

$$(n+1)e^{-n} < 0.001 \quad \begin{matrix} \leadsto \text{by hand: guess \& try} \\ n=9 \quad 0.0014 \\ n=10 \quad 0.0005 \end{matrix}$$

ex. Same thing for $\sum_{n=1}^{\infty} \frac{1}{n^2}$ conv p-series $p=2 < 1$

$$a) \sum_{n=1}^{\infty} \frac{1}{n^2} \approx S_4 = 1 + \frac{1}{4} + \frac{1}{9} + \frac{1}{16}$$

$$\approx 1.42$$

$$b) R < \int_{4}^{\infty} \frac{1}{x^2} dx$$

$$= \int_{4}^{\infty} x^{-2} dx$$

$$= \lim_{t \rightarrow \infty} \left[-\frac{1}{x} \right]_4^t$$

$$= \lim_{t \rightarrow \infty} \left[\left(\frac{1}{t} \right)^{\cancel{\rightarrow 0}} + \frac{1}{4} \right]$$

$$= \frac{1}{4} = 0.25$$

c) Error to be 10^{-6} :

$$R < \int_n^\infty \frac{1}{x^2} dx < 10^{-6}$$

$$\lim_{t \rightarrow \infty} \left[-\frac{1}{x} \right]_n^t < 10^{-6}$$

$$\lim_{t \rightarrow \infty} \left[-\frac{1}{t} + \frac{1}{n} \right] < 10^{-6}$$

$$\frac{1}{n} < 10^{-6}$$

$$n > 10^6$$

Creating a tighter interval for S in the special case of the Int-test

we have shown that $R < \int_n^\infty f(x)dx$

Now consider:

Use left hand pts

$$R = a_{n+1} + a_{n+2} + \dots$$

$$R > \int_{n+1}^{\infty} f(x) dx$$

Putting these together:

$$\int_{n+1}^{\infty} f(x) dx < R < \int_n^{\infty} f(x) dx$$

$$\text{But, wait! } R = S - S_n$$

$$\int_{n+1}^{\infty} f(x) dx < S - S_n < \int_n^{\infty} f(x) dx$$

$$S_n + \int_{n+1}^{\infty} f(x) dx < S < S_n + \int_n^{\infty} f(x) dx$$

$\sum a_n$

ex. $\sum_{n=1}^{\infty} \frac{1}{n^3}$

Use S_5 to build an interval containing s

$$S_5 = 1 + \frac{1}{2^3} + \frac{1}{3^3} + \frac{1}{4^3} + \frac{1}{5^3} \approx 1.1857$$

$$\int_6^{\infty} \frac{1}{x^3} dx = \lim_{t \rightarrow \infty} \left[-\frac{1}{2x^2} \right]_6^t = \frac{1}{2 \cdot 6^2} = \frac{1}{72} \approx 0.0139$$

$$\int_5^{\infty} \frac{1}{x^3} dx = \lim_{t \rightarrow \infty} \left[-\frac{1}{2x^2} \right]_5^t = \frac{1}{50} \approx 0.02$$

$$1.857 + 0.0139 < \sum \frac{1}{n^3} < 1.857 + 0.02$$

$$1.1996 < \sum \frac{1}{n^3} < 1.2057$$

Direct Comparison Test

If $\sum a_n$ & $\sum b_n$ are series with $a_n, b_n > 0$

(i) If $0 < a_n < b_n$ & $\sum b_n$ converges,
then $\sum a_n$ conv as well

(ii) If $0 < a_n < b_n$ & $\sum a_n$ diverges,
then $\sum b_n$ div as well.

Proof: Case (i) $0 < a_n < b_n$, $\sum b_n$ conv

we will show that $\left\{ S_n = \sum_{i=1}^n a_i \right\}$ is incr & bounded above

Incr: Show $S_n > S_{n-1}$

$$S_n - S_{n-1} > 0$$

$$a_n > 0$$

Bounded above: Let $t_n = \sum_{i=1}^n b_i$ be the partial sums $\sum b_n$

$\sum b_n$ is convergent

$\therefore \sum b_n$ is bounded

which means there is a number M

such that $t_n \leq M$ for all n .

and since $a_n \leq b_n \leq M$

$$\therefore S_n \leq t_n \leq M$$

Since $\{s_n\}$ is inc & bnd above,

$$\{s_n\} \text{ conv so } \sum a_n \text{ conv}$$

February 19

Note on homework:

$$\frac{2x+3}{2x+2} = \frac{2x+3}{2x+3-1}$$

$$\begin{aligned} &\frac{1}{1 - \frac{1}{2x+3}} \\ &\downarrow \\ &\frac{- (2x+3)}{1 - (2x+3)} \end{aligned}$$

Direct Comparison Test (DCT)

If $\sum a_n, \sum b_n$ with $a_n, b_n > 0$ and if
 $0 < a_n < b_n$ for all n .

(1) If $\sum b_n$ converges, then $\sum a_n$ converges as well

(2) If $\sum a_n$ diverges, then $\sum b_n$ diverges also

"known" series ex. p-series

geometric series

others: proven for other series

Limit Comparison Test (LCT)

If $\sum a_n, \sum b_n$ with $a_n, b_n > 0$

(1) If $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = L$ with $0 < L < \infty$, then

$\sum a_n$ & $\sum b_n$ either both converge or both diverge

(2) If $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = 0$ and $\sum b_n$ converges, then

$\sum a_n$ converges also

If $\sum b_n$ conv,

$\lim_{n \rightarrow \infty} b_n = 0$ 0 really fast

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \frac{\lim_{n \rightarrow \infty} a_n}{0} = 0$$

(3) If $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \infty$ and $\sum b_n$ div, then $\sum a_n$ div

Proof of (1)

If $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = L$, therefore for any $\epsilon > 0$

there exists a N_ϵ such that for any $n \geq N_\epsilon$,

$$\left| \frac{a_n}{b_n} - L \right| < \epsilon$$

$$\text{So choose } \epsilon = \frac{1}{2}L$$

Eventually ($\forall n \geq N_{\frac{1}{2}L}$)

$$\left| \frac{a_n}{b_n} - L \right| < \frac{1}{2}L$$

$$-\frac{1}{2}L < \frac{a_n}{b_n} - L < \frac{1}{2}L$$

$$\frac{1}{2}L < \frac{a_n}{b_n} < \frac{3}{2}L$$

$$\frac{1}{2}L b_n < a_n < \frac{3}{2}L b_n \quad \text{since } b_n > 0$$

$$\underbrace{}_{(2)} \quad \underbrace{}_{(1)}$$

① If $\sum b_n$ conv, then $\sum \frac{3}{2} L b_n$ is conv

(multiple of conv series)

$$0 < a_n < \frac{3}{2} L b_n$$

∴ $\sum a_n$ conv as well by Direct Comparison Test (DCT)

② If $\sum b_n$ div, then $\sum \frac{1}{2} L b_n$ also div

$$0 < \frac{1}{2} L b_n < a_n$$

$\sum a_n$ div also by BCT

- Decide if the Direct Comparison Test can be applied in each case. If it applies, use it to determine if the series converges or diverges.

a) $\sum \frac{1}{2^n + 1}$

$$0 < 2^n + 1 > 2^n$$

$$0 < \frac{1}{2^n + 1} < \frac{1}{2^n}$$

$\sum \frac{1}{2^n}$ is a conv geo series $r = \frac{1}{2} < 1$

∴ $\sum \frac{1}{2^n + 1}$ conv also by DCT

c) $\sum \frac{\ln n}{n}$

$$0 < \frac{\ln n}{n} > \frac{1}{n}$$

$\sum \frac{1}{n}$ is a p-series where $p=1$ and thus
diverges. \therefore By the DCT, $\sum \frac{\ln n}{n}$ div as well.

d) $\sum \frac{\sin(n)}{n^2}$

$\frac{\sin n}{n^2}$ is not always > 0 so the DCT does
not apply

$$e) \sum \sin\left(\frac{1}{n^2}\right)$$

$$0 < \sin\left(\frac{1}{n^2}\right) < \frac{1}{n^2}$$

$\sum \frac{1}{n^2}$ is a p-series where $p=2>1$ and thus converges. \therefore By the DCT, $\sum \sin\left(\frac{1}{n^2}\right)$ conv as well.

$$b) \sum \frac{1}{2^n - 1}$$

$$\frac{1}{2^n - 1} < \frac{1}{n^2} \text{ for } n \geq 100$$

$$2^n - 1$$

$$2^{100} - 1 > 100^2 ?$$

$\sum \frac{1}{n^2}$ is a p-series where and $\frac{d}{dn} 2^n = 2^n \ln 2 \underset{n \rightarrow \infty}{\approx} 2 \cdot 100$

$$2^n = n^2$$

$$(2^n)'' = 2^n (\ln 2)^2 > 2$$

$$\ln 2^n = \ln n^2$$

$$n \ln 2 = 2 \ln n$$

2. Apply the Limit Comparison Test to each of the following series to determine if possible whether the series converges or diverges.

a) $\sum \frac{1}{2^n - n}$

$\sum \left(\frac{1}{2}\right)^n$ is a converging series (geometric where $|r| < 1$)

$$\lim_{n \rightarrow \infty} \frac{2^n - n}{2^n} = \lim_{n \rightarrow \infty} \left(1 - \left(\frac{n}{2^n}\right)\right)^0 = 1 = L$$

By the LCT, $2^n - n$ conv to 0

b) $\sum \frac{1}{n \ln n}$

↳ will fail with LCT

c) $\sum \frac{(3n+1)\sqrt{n^3 + 3}}{n\sqrt[3]{n^6 - 3n + 1}}$

Dominant terms!

$$\sim \frac{n \cdot n^{3/2}}{n \cdot n^2} \sim \frac{1}{\sqrt{n}} \xrightarrow{n \rightarrow \infty} 0^+ \quad (p = \frac{1}{2} < 1)$$

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \frac{(3n+1) \sqrt{n^3 + 3}}{n \sqrt[3]{n^6 - 3n + 1}} \cdot n^{1/2}$$

$$= \frac{n \left(3 + \frac{1}{n}\right) n^{3/2} \sqrt{1 + \frac{3}{n^3}}}{n^2 \sqrt[3]{1 - \frac{3}{n^3} + \frac{1}{n^6}}} \cdot n^{1/2}$$

$$\begin{aligned}
 &= \frac{n^{\gamma}}{n^2} \cdot \frac{\left(3 + \frac{1}{n}\right) \sqrt{1 + \frac{3}{n^3}}}{\sqrt{1 - \frac{3}{n^3} + \frac{1}{n^6}}} \\
 &= 3
 \end{aligned}$$

$$0 < L = 3 < \infty$$

$\sum a_n$ behaves like $\sum \frac{1}{n^{1/2}}$

\therefore By LCT, div.

DCT & Error Estimation

$$S_n = \sum_{i=1}^n a_i \quad b_n = \sum_{i=1}^n b_i$$

$$R = |S - S_n| \quad T = |b - b_n|$$

$$0 < a_n < b_n$$

known

$$\therefore 0 < R < T$$

↑
 error using
 S_n as approx

↓
 error using
 the with partial sum
 of b_n

Use s_n with error T (which is easier to calculate than R)

3. For each of a) $\sum_{n=1}^{\infty} \frac{1}{2^n + 1}$ and b) $\sum_{n=1}^{\infty} \frac{\sin^2 n}{n^3}$

i) Use the DCT to show that the sum converges.

ii) Use s_5 to estimate the value of the sum.

iii) Estimate the error involved in your answer to (ii).

a) $\sum \frac{1}{2^n + 1}$ compared to $\sum \frac{1}{2^n}$ conv. geo series

$$s_5 = \frac{1}{2^1 + 1} + \frac{1}{2^2 + 1} + \dots + \frac{1}{2^5 + 1}$$

$$\approx 0.73357$$

$$R = a_6 + a_7 + a_8 + \dots < b_6 + b_7 + b_8 + \dots$$

$$< \sum_{n=6}^{\infty} \frac{1}{2^n} \approx \frac{1}{2^6} + \frac{1}{2^7} + \frac{1}{2^8} + \dots$$

$$= \frac{1}{1-r} = \frac{\frac{1}{2^6}}{1 - \frac{1}{2}}$$

$$= \frac{1}{2^5} = \boxed{\frac{1}{32}}$$

b) $\sum \frac{\sin^2 n}{n^3}$

i) $0 \leq \frac{\sin^2 n}{n^3} < \frac{1}{n^3}$

$\sum \frac{1}{n^3}$ is a p-series where $p=3 > 1$ and thus converges.

∴ By the DLT, $\sum \frac{\sin^2 n}{n^3}$ also converges

ii) $S_5 = \sum_{n=1}^5 \frac{\sin^2 n}{n^3}$

≈ 0.82847

iii)

$$\begin{aligned} R &= a_6 + a_7 + a_8 + \dots < b_1 + b_2 + b_3 + \dots < \int_5^\infty \frac{1}{x^3} dx \\ &= \lim_{t \rightarrow \infty} \left[-\frac{1}{2} x^{-2} \right]_5^t \\ &= \frac{1}{50} \end{aligned}$$

Feb. 21

Alternating Series Test

If $\{a_n\}$ of (1) positive terms ($a_n > 0$) with

(2) $\{a_n\}$ is decreasing

(3) $\lim_{n \rightarrow \infty} a_n = 0$

and if $b_n = (-1)^{n+1} a_n$ (or $b_n = (-1)^n a_n$)

then $\sum b_n$ converges.

Proof: $S_n = b_1 + b_2 + \dots + b_n = a_1 - a_2 + a_3 - \dots \pm a_n$

$\sum b_n = \lim_{n \rightarrow \infty} S_n \leftarrow$ we need to show that $\{S_n\}$ is con

Examine graph of S_n

Examine: $\{S_{2n}\}$ the subsequence of even terms

$$S_{2n} = a_1 - a_2 + a_3 - a_4 + a_5 - a_6 + \dots + a_{2n-3} - a_{2n-2} + a_{2n-1} - a_{2n}$$

\$a_1 - a_2\$ \$a_3 - a_4\$ \$a_5 - a_6\$ \$\dots\$ \$a_{2n-3} - a_{2n-2}\$ \$a_{2n-1} - a_{2n}\$
\$S_2\$ \$S_4\$ \$S_6\$
\$S_{2(n-1)}\$

(Consecutive even terms)

$$\Rightarrow S_{2n} = S_{2n-2} + a_{2n-1} - a_{2n}$$

$$\Rightarrow S_{2n} - S_{2n-2} = a_{2n-1} - a_{2n} > 0 \text{ since } \{a_n\} \downarrow$$

$\therefore \{S_{2n}\}$ is incr

$$\begin{aligned}
 S_{2n} &= a_1 - a_2 + a_3 - a_4 + a_5 - a_6 + \dots + a_{2n-3} - a_{2n-2} + a_{2n-1} - a_{2n} \\
 &= a_1 - (a_2 - a_3) - (a_4 - a_5) - \dots - a_{2n}
 \end{aligned}$$

⊕ ⊕ ⊕

$\therefore \{S_{2n}\}$ is bounded above by a_1

$\therefore \{S_{2n}\} \uparrow$, bounded

$\therefore \{S_{2n}\}$ converges by the BMCT

Examine $\{S_{2n+1}\}$ the odd terms and let $\lim_{n \rightarrow \infty} S_{2n} = \Delta$

notice:

$$S_{2n+1} = S_n + a_{2n+1}$$

$$\lim_{n \rightarrow \infty} S_{2n+1} = \lim_{n \rightarrow \infty} S_{2n} + \lim_{n \rightarrow \infty} a_{2n+1}$$

$$= \Delta + 0$$

$$= \Delta$$

Since $\lim_{n \rightarrow \infty} S_{2n} = \Delta$

$$\text{if } \lim_{n \rightarrow \infty} S_{2n+1} = \Delta$$

$$\therefore \lim_{n \rightarrow \infty} S_n = \Delta \text{ also}$$

$$\therefore \sum b_n = \Delta$$

conv

Error estimates

Using S_n as an estimate for $S = \sum b_n$,

$$R_n = |S - S_n| < a_{n+1} = |b_{n+1}| \leftarrow \begin{array}{l} \text{"first neglected} \\ \text{"term"} \end{array}$$

Note: Error Estimates:

- integral test $R_n < \int_n^\infty f(x) dx$

- DCT $R_n < \text{geo}$
 \downarrow direct comparison test

- AST $R_n < a_{n+1}$
 \downarrow alternating series test

ex. $\sum_{n=2}^{\infty} \frac{1}{n \ln n}$ vs $\sum_{n=2}^{\infty} \frac{(-1)^n}{n \ln n}$

\downarrow from before: Int test: div

apply AST: $a_n = |b_n| = \frac{1}{n \ln n}$

① $a_n > 0$ $n > 2; n, \ln n > 0$

② $\{a_n\} \downarrow$ $n, \ln n \uparrow \therefore n \ln n \uparrow \therefore \frac{1}{n \ln n} \downarrow$

then n

$$\textcircled{3} \lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{n \ln n} = 0$$

∴ By AST $\sum \frac{(-1)^n}{n \ln n}$ converges

Vocabulary: $\sum \frac{(-1)^n}{n \ln n}$ is conditionally convergent
(abs. is div.)

ex. estimate $\sum_{n=2}^{\infty} \frac{(-1)^n}{n \ln n}$ using 4 terms and give a bound

on the error

$$s_4 = \frac{1}{2 \ln 2} - \frac{1}{3 \ln 3} + \frac{1}{4 \ln 4} - \frac{1}{5 \ln 5}$$

$$\text{with error } < a_5 = \frac{1}{6 \ln 6} \quad \leftarrow \begin{matrix} \text{recall starting} \\ \text{at } n=2 \end{matrix}$$

ex. Consider $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^2}$

a) Use the AST to show that the series converges

b) Use s_6 to approximate the series & give a bound on the error

c) How many terms are needed to guarantee an approximation correct to 7 decimals?

$$a) a_n = |b_n| = \frac{1}{n^2}$$

$$\textcircled{1} \quad a_n > 0 \quad \text{for } n > 1, \quad n^2 > 0 \quad \therefore \frac{1}{n^2} > 0$$

$$\textcircled{2} \quad \{a_n\} \downarrow \quad n^2 \uparrow \text{ for } n > 1 \quad \therefore \frac{1}{n^2} \downarrow$$

$$\textcircled{3} \quad \lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{n^2} = 0$$

$$\therefore \text{By ACT} \quad \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^2} \quad \text{conv}$$

$$b) S_6 = 1 - \frac{1}{4} + \frac{1}{9} - \frac{1}{16} + \dots + \frac{1}{36} \\ \approx 0.810833$$

$$R_n < |S_7| = \frac{1}{49}$$

$$c) R_n < \left| \frac{1}{(n+1)^2} \right| < 0.00000005 \quad \begin{array}{l} \text{7th decimal place} \\ \text{(round down will be } 10^{-7}) \end{array}$$

$$5 \times 10^{-8} > \frac{1}{(n+1)^2}$$

$$(n+1)^2 > \frac{1}{5} \times 10^{-8}$$

$$n+1 > \sqrt{\frac{1}{5} \times 10^{-8}}$$

$$n > \sqrt{2 \times 10^{-9}} - 1$$

Absolute Convergence

Defn: A series $\sum a_n$ is called absolutely convergent if $\sum |a_n|$ converges.

$$\sum |a_n| \text{ converges}.$$

- A convergent that is not absolutely convergent is called conditionally convergent.

ex. (Back to previous)

$$\sum \frac{(-1)^{n+1}}{n^2} \text{ conv by AST}$$

$$\sum \left| \frac{(-1)^{n+1}}{n^2} \right| \text{ conv by p-series where } p=2 > 1$$

$$\therefore \sum \frac{(-1)^{n+1}}{n^2} \text{ is absolutely conv.}$$

ex. If $\sum b_n$ is conv and $b_n > 0$

$$\sum |b_n| = \sum b_n \left(\begin{array}{l} \text{all conv (pos term)} \\ \text{series are abs conv} \end{array} \right)$$

Absolute Conv Implies Conv

Theorem: If $\sum |a_n|$ is conv, then $\sum a_n$ is also conv

All series

Ex.

a) $\sum \frac{(-1)^{n+1}}{n^2}$ is conv by AST

Alternate logic: Examine $\sum \left| \frac{(-1)^{n+1}}{n^2} \right| = \sum \frac{1}{n^2}$ conv preserved

$\therefore \sum \frac{(-1)^{n+1}}{n^2}$ is abs conv, and is therefore conv

b) $\sum \frac{\sin(n)}{n^2}$ ← not always positive
← not alternating so AST does not apply

Examine $\sum \left| \frac{\sin(n)}{n^2} \right|$

$$0 < |\sin(n)| < 1$$

$$\therefore 0 < \left| \frac{\sin(n)}{n^2} \right| < \frac{1}{n^2}$$

$$\therefore \sum \left| \frac{\sin(n)}{n^2} \right| \text{ conv by DCT}$$

$$\therefore \sum \frac{\sin(n)}{n^2} \text{ conv also by abs conv}$$

Feb. 23

Theorem: Abs conv \Rightarrow conv

$$\sum |a_n| \text{ conv} \Rightarrow \sum a_n \text{ conv}$$

Proof: Notice

$$0 \leq a_n + |a_n| \leq 2|a_n|$$

Let $\sum |a_n|$ be conv, then $\sum 2|a_n|$ is also conv

By DCT, $\sum (a_n + |a_n|)$ is conv.

Notice that $\sum a_n = \underbrace{\sum (a_n + |a_n|)}_{\text{conv by DCT}} - \underbrace{\sum |a_n|}_{\text{conv by hypothesis}}$

$\therefore \sum a_n$, as the difference of 2 conv series is conv as well.

Ex. Classify each as div, abs conv, or cond conv.

$$\textcircled{1} \quad \sum \frac{(-1)^{n+1}}{n}$$

$$\textcircled{2} \quad \sum \frac{(-1)^{n+1}}{2^n + 1}$$

$$\textcircled{3} \quad \sum (-1)^n \left(\frac{n}{n+1} \right)^n$$

$$1) \quad \sum \frac{(-1)^{n+1}}{n}$$

$$\sum \left| a_n \right| = \sum \frac{1}{n} \text{ div since it's a } p\text{-series}$$

where $p = 1 \leq 1$

AST:

$$\textcircled{1} \quad \left| \frac{(-1)^{n+1}}{n} \right| = \frac{1}{n} > 0$$

$$\textcircled{2} \quad \left\{ \frac{1}{n} \right\} \downarrow \text{since } n \uparrow \therefore \frac{1}{n} \downarrow$$

$$\textcircled{3} \quad \lim_{n \rightarrow \infty} \frac{1}{n} = 0$$

$$\therefore \text{By AST, } \sum \frac{(-1)^{n+1}}{n} \text{ conv}$$

$\therefore \sum \frac{(-1)^{n+1}}{n}$ is cond conv

$$2) \sum \left| \frac{(-1)^{n+1}}{2^n + 1} \right| = \sum \frac{1}{2^n + 1} \leq \sum \frac{1}{2^n}$$

$\sum \left(\frac{1}{2} \right)^n$ is a geometric conv since $r = \frac{1}{2} < 1$ by the
 $\therefore \sum \frac{1}{2^n + 1}$ conv as well by the DCT

$\therefore \sum \frac{1}{2^n + 1}$ is abs conv

$$3) \sum |a_n| = \sum \left(\frac{n}{n+1} \right)^n$$

$$\lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right)^n = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^n = e^{-1}$$

$\therefore \sum |a_n|$ div by n^{th} term test

$$\lim_{n \rightarrow \infty} (-1)^n \left(\frac{n}{n+1} \right)^n \text{ DNE}$$

How do we know?

even &
odds are
going to plus
different places

$$\text{Even: } \lim_{n \rightarrow \infty} a_{2n} = \frac{1}{e}$$

$$\text{odd: } \lim_{n \rightarrow \infty} a_{2n+1} = -\frac{1}{e}$$

\therefore div by n^{th} term test

Rearrangements

$$\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} \text{ conv.}$$

$$\text{Let } S = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} \quad S = \ln 2$$

$$S = (1) - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \frac{1}{7} - \frac{1}{8} + \dots$$

$$\frac{1}{2} S = \frac{1}{2} - \frac{1}{4} + \frac{1}{6} - \frac{1}{8}$$

$$\frac{3}{2} S = 1 + \frac{1}{3} - \frac{1}{2} + \frac{1}{5} + \frac{1}{7} - \frac{1}{4} + \dots$$

Same terms in a different order

commutativity of addition

gives a finite value

adding in
a different
order

Riemann Rearrangement Theorem

If $\sum a_n$ is conditionally conv.,

then the terms of the series can be rearranged to give any value we like.

This is not true for abs conv

Ratio Test

(idea: geo series $r = \frac{a_{n+1}}{a_n}$)

$$|r| < 1$$

A series that passes
the ratio test is "almost" geometric

If $\sum a_n$ is a series of positive terms ($a_n > 0$)

if $\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n}$ exists and equals $L < 1$

then $\sum a_n$ conv. $\begin{cases} \text{if } L > 1, \text{ series div} \\ L = 1, \text{ test fails} \end{cases}$

Root Test

If $\sum a_n$ is a series with positive terms ($a_n > 0$)

and if $\lim_{n \rightarrow \infty} \sqrt[n]{a_n}$ exists and equals $L < 1$,

then $\sum a_n$ conv. $\begin{cases} \text{if } L > 1, \text{ series div} \\ L = 1, \text{ test fails} \end{cases}$

ex. Categorize each as div, abs conv, or cond conv

$$\textcircled{1} \sum \frac{(-1)^n n!}{n^n}$$

$$\textcircled{2} \sum \left(\frac{n}{n+1} \right)^n$$

$$\textcircled{3} \sum n \left(-\frac{3}{2} \right)^n$$

$$1) \sum |a_n| = \sum \frac{n!}{n^n}$$

$$\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = \lim_{n \rightarrow \infty} \frac{(n+1)!}{(n+1)^{n+1}} \cdot \frac{n^n}{n!}$$

$$= \lim_{n \rightarrow \infty} \frac{n!}{(n+1)^{n+1}} \cdot \frac{n^n}{n!}$$

$$= \lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right)^n$$

$$= \frac{1}{e} < 1$$

$\therefore \sum |a_n|$ conv by the ratio test

$\therefore \sum a_n$ is abs conv

$$2) \lim_{n \rightarrow \infty} \sqrt[n]{\left(\frac{n}{n+1} \right)^{n^2}}$$

$$= \lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right)^n$$

$$= \frac{1}{e} < 1$$

\therefore By the root test, $\sum a_n$ conv. Also $\sum |a_n| = \sum a_n$

$\therefore \sum a_n$ is abs conv

$$3) \sum n \left(-\frac{3}{2}\right)^n = \sum (-1)^n n \left(\frac{3}{2}\right)^n$$

Note: by definition, $\sum n a_n$
is not geo. But can compare
to geo series

$$\sum |a_n| = \sum n \left(\frac{3}{2}\right)^n$$

$$\lim_{n \rightarrow \infty} n \left(\frac{3}{2}\right)^n = \infty$$

By the n^{th} term test, $\sum |a_n|$ div

$$\lim_{n \rightarrow \infty} n \left(-\frac{3}{2}\right)^n \text{ DNE} \quad \text{since even terms: } \lim_{n \rightarrow \infty} a_n = -\infty$$

odd terms: $\lim_{n \rightarrow \infty} a_n = \infty$

$\therefore \sum a_n$ div

Power Series

$$\sum_{n=0}^{\infty} c_n (x-a)^n$$

c_n 's constant
 a constant

Theorem:

If $\sum c_n (x-a)^n$ is a power series,

there is a value $R \in [0, \infty)$ (radius of convergence),

such that the power series converges for all x

such that $|x-a| < R$, diverges for all x

such that $|x-a| > R$ (if $|x-a| = R$, either conv or div is possible)

Feb. 26

Power series

$$\sum_{n=0}^{\infty} C_n (x-a)^n$$

Why power series?

- They're cool!
- good for approximations \rightarrow calculators
- evaluating numerical series

$$e^2 = e \cdot e$$

$$e^{-4} = \frac{1}{e^2 e^2}$$

$$e^{2.5} = e^2 e^{1.2} = e^2 \sqrt{e}$$

$$e^\pi = ?$$

$$= \sum_{n=0}^{\infty} \frac{\pi^n}{n!} \leftarrow \text{conv}$$

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

fill in "gaps" of transcendental functions

ex. $\int e^{x^2} dx$ FTC \rightarrow guarantees answer

Answer is expressible as a series

Power series

$$\sum_{n=0}^{\infty} C_n(x-a)^n \sim \text{Function series: } \underline{\sum_{n=0}^{\infty} C_n(g(x))^n}$$

Interval of convergence

R - radius of convergence $R \in [0, \infty)$

$$|x-a| < R \text{ conv } \rightarrow a-R < x < a+R$$

$$|x-a| > R \text{ div}$$

$$|x-a| = R \text{ anything possible conv or div}$$

when $R=0$: "interval" $[a, a]$

$$f(x) = \sum_{n=0}^{\infty} c_n(x-a)^n ; f(a) = c_0$$

$$= c_0 + c_1(x-a) + c_2(x-a)^2 \dots$$

Series always conv at $x=a$

Ex: Find the interval of conv of $\sum_{n=1}^{\infty} \frac{\ln n}{n} (x-2)^n$.

Classify the pts of conv as absolute or conditional

Sol'n: By ratio test, series will conv when

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| < 1$$

$$= \lim_{n \rightarrow \infty} \left| \frac{\ln(n+1)}{n+1} \cdot \frac{(x-2)^{n+1}}{\ln n \cdot (x-2)^n} \right| < 1$$

$$= \lim_{n \rightarrow \infty} \left| \frac{\ln(n+1)}{\ln n} \cdot \frac{n}{n+1} \cdot (x-2) \right| < 1$$

$$= |x-2| \lim_{n \rightarrow \infty} \frac{\ln(n+1)}{\ln(n)} \cdot \lim_{n \rightarrow \infty} \frac{n}{n+1} < 1$$

$$= |x-2| < 1$$

$$-1 < x-2 < 1$$

$$1 < x < 3$$

\downarrow Test end pts

(1, 3) absolute convergence since ratio test fails at abs vnl

$$R = 1$$

$$\text{centre} = a = 2$$

$$\text{at } x=1$$

$$\sum \frac{\ln n}{n} (1-2)^n$$

$$= \sum \frac{(-1)^n \ln n}{n} \rightarrow \sum a_n$$

$$\text{at } x=3$$

$$\sum \frac{\ln n}{n} (3-2)^n$$

$$= \sum \frac{\ln n}{n} \rightarrow \sum |a_n|$$

↑ Test this one first

use DCT

$$\ln n > 1 \quad (\text{for } n > e)$$

$$\frac{\ln n}{n} > \frac{1}{n} > 0$$

Since $\sum \frac{1}{n}$ is div p-series ($p=1$),

then $\sum \frac{\ln n}{n}$ div also by DCT

AST: ① $\ln n, n, \Theta \therefore \frac{\ln n}{n} \Theta$

② $\frac{\ln n}{n} \downarrow$ since $f'(x) = \frac{\frac{1}{x} \cdot x - \ln x}{x^2}$

$$= \frac{1 - \ln x}{x^2} < 0 \text{ for } x > e$$

(3) $\lim_{n \rightarrow \infty} \frac{\ln n}{n} = 0$ by growth hierarchy

$$\therefore \sum \frac{(-1)^n \ln n}{n} \text{ conv by AST}$$

$$\therefore \sum_{n=1}^{\infty} \frac{\ln n}{n} (x-2)^n \text{ conv on } [1, 3]$$

absolutely on $(1, 3)$

conditionally at $x=1$

For each of the following, find the center, radius and interval of convergence (including the endpoints). State clearly where the convergence is absolute, and where it is conditional.

Remember the general procedure:

- Examine $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right|$ (or $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|}$) to determine if the series converges only at $x = a$ or if the series converges absolutely on some open interval.
- If the radius of convergence R is such that $0 < R < \infty$, i.e. the series converges absolutely not on \mathbb{R} but on $(a-R, a+R)$, test separately for convergence at the endpoints: $x = a-R$ and $x = a+R$.

Often, this will mean testing two related series $\sum c_n$ and $\sum b_n$, where $b_n > 0$, and $c_n = (-1)^n b_n$ is alternating. For efficiency:

- test $\sum b_n$ first, since if it converges, $\sum c_n$ will also converge (because absolute convergence guarantees convergence).
- test $\sum c_n$ (using the AST) only if $\sum b_n$ diverges.

$$1. \sum_{n=0}^{\infty} \frac{(-3)^{n+1}}{\sqrt{n+1}} (5-2x)^n$$

Ratio Test:

$$\lim_{n \rightarrow \infty} \left| \frac{(-3)^{n+1}}{\sqrt{n+2}} (5-2x)^{n+1} \cdot \sqrt{n+1}} \over (5-2x)^n \cdot (-3)^{n+1} \right|$$

$$= 3|5-2x| \lim_{n \rightarrow \infty} \sqrt{\frac{n+1}{n+2}}$$

$$= 3|5-2x| < 1 \quad \text{or} \quad 3|2x-5| < 1$$

$$3 \cdot 2|x - \frac{5}{2}| < 1$$

$$-1 < 15 - 6x < 1$$

$$\left| x - \frac{5}{6} \right| < \frac{1}{6}$$

$$1 > 6x - 15 > -1$$

$$a \qquad R$$

$$16 > 6x > 14$$

$$\frac{8}{3} > x > \frac{7}{3}$$

$$\left(\frac{7}{3}, \frac{8}{3} \right) \sim \text{abs conv}$$

$$R = \frac{1}{6}$$

$$\text{center} = \frac{15}{6} = \frac{5}{2}$$

at $x = \frac{7}{3}$:

$$\sum_{n=0}^{\infty} \frac{(-3)^{n+1}}{\sqrt{n+1}} \left(5 - 2 \cdot \frac{7}{3} \right)^n$$

$$= \sum_{n=0}^{\infty} \frac{(-3)^{n+1}}{\sqrt{n+1}} \left(\frac{1}{3} \right)^n$$

$$= 3 \sum_{n=0}^{\infty} \frac{(-1)^{n+1}}{\sqrt{n+1}}$$

at $x = \frac{8}{3}$:

$$\sum_{n=0}^{\infty} \frac{(-3)^{n+1}}{\sqrt{n+1}} \left(5 - 2 \cdot \frac{8}{3} \right)^n$$

$$= \sum_{n=0}^{\infty} \frac{(-3)^{n+1}}{\sqrt{n+1}} \left(-\frac{1}{3} \right)^n \sim (-3)^n$$

$$= \sum_{n=0}^{\infty} \frac{-3}{\sqrt{n+1}}$$

$$= -3 \sum_{n=0}^{\infty} \frac{1}{\sqrt{n+1}}$$

LCT! $\lim_{n \rightarrow \infty} \frac{\frac{1}{\sqrt{n+1}}}{\frac{1}{\sqrt{n+1}}} = 1$

$$= \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{\sqrt{n+1}} = \frac{\sqrt{n}}{\sqrt{n}\sqrt{1+\frac{1}{n}}} = 1$$

$\therefore \sum \frac{1}{\sqrt{n}}$ is a p-series where $p = \frac{1}{2} \leq 1$
and thus diverges.

$$\therefore \sum_{n=0}^{\infty} \frac{1}{\sqrt{n+1}} \text{ div also}$$

AST:

$$\textcircled{1} \quad \frac{1}{\sqrt{n+1}} > 0$$

$$\textcircled{2} \quad \sqrt{n} \uparrow \therefore \sqrt{n+1} \uparrow \therefore \frac{1}{\sqrt{n+1}} \downarrow$$

$$\textcircled{3} \quad \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n+1}} = 0$$

\therefore By AST, $\sum_{n=0}^{\infty} \frac{(-1)^{n+1}}{\sqrt{n+1}}$ conv

$\therefore \sum_{n=0}^{\infty} \frac{(-3)^{n+1}}{\sqrt{n+1}} (5-2x)^n$ conv on $\left[\frac{7}{3}, \frac{8}{3} \right]$
conditionally at $x = \frac{7}{3}$
absolutely on $\left(\frac{7}{3}, \frac{8}{3} \right)$

$$2. \sum_{n=0}^{\infty} \frac{(2x+3)^n}{5^n(n^2+1)}$$

$$\lim_{n \rightarrow \infty} \left| \frac{(2x+3)^{n+1}}{5^{n+1} ((n+1)^2 + 1)} \cdot \frac{5^n(n^2+1)}{(2x+3)^n} \right|$$

$$= \frac{1}{5} |2x+3| \lim_{n \rightarrow \infty} \left| \frac{n^2+1}{(n+1)^2+1} \right|$$

$$\geq \frac{1}{5} |2x+3| \lim_{n \rightarrow \infty} \left| \frac{x^2(1+\frac{1}{n^2})}{x^2(1+\frac{1}{n})^2 + \frac{1}{n^2}} \right|$$

$$\geq \frac{1}{5} |2x+3| < 1$$

$$\frac{1}{5} 2|x+\frac{3}{2}| < 1$$

$$|x+\frac{3}{2}| < \frac{5}{2}$$

$$a = -\frac{3}{2}, R = \frac{5}{2}$$

$$(-4, 1)$$

at $x = -4$:

$$\sum_{n=0}^{\infty} \frac{(-5)^n}{5^n(n^2+1)}$$

$$\sum_{n=0}^{\infty} \frac{(-1)^n}{n^2+1}$$

$$S_2 = \sum_{n=0}^{\infty} \frac{5^n}{5^n(n^2+1)}$$

$$= \sum_{n=0}^{\infty} \frac{1}{n^2+1}$$

at $x = 1$:

$$0 < \frac{1}{n^2+1} < \frac{1}{n^2}$$

$\sum \frac{1}{n^2}$ conv since it's a p-test where

$$p = 2 > 1$$

$\therefore \sum_{n=0}^{\infty} \frac{1}{n^2}$ conv also by the DCT

absolute convergence

Since $\sum \left| \frac{(-1)^n}{n^2+1} \right| = \sum \frac{1}{n^2+1}$, the series conv at $x = -4$ also.

$$\therefore \sum_{n=0}^{\infty} \frac{(2x+3)^n}{5^n (n^2+1)} \text{ conv absolutely on } [-1, 4]$$

Constructing Power Series

- { - Geometric Series Formula (when it applies)
- Taylor's Formula
- new series from old ones
 - composition
 - multiplication / division
 - integration / differentiation

Taylor's Formula

If $f(x)$ is an infinitely differentiable function at $x=a$,

then, the Taylor series generated by $f(x)$ at $x=a$ is :

$$T(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x-a)^n$$

Notes:

- We aren't guaranteed that $f(x) = T(x)$
 $(f(x) \neq T(x) \text{ is rare, but does occur})$

- Note that $T^{(n)}(a) = f^{(n)}(a)$
by design (easy to check)
(derivatives \rightarrow shape of graph)

— $f(a) \xrightarrow{\text{blue arrow}} T(x) = \frac{f^{(0)}(a)}{0!} + \frac{f^{(1)}(a)}{1!}(x-a) + \frac{f^{(2)}(a)}{2!}(x-a)^2 + \dots$

—

- convergence of $T(x) \rightarrow$ conv of a power series
(guaranteed to converge at $x=a$)

- MacLaurin series : Taylor series at $a=0$

ex. Use the formula to generate the MacLaurin series for

$$f(x) = e^x$$

$$f^{(0)}(x) = e^x \quad f^{(0)}(0) = e^0 = 1$$

$$f^{(1)}(x) = e^x \quad f^{(1)}(0) = e^0 = 1$$

$$f^{(2)}(x) = e^x \quad \vdots$$

$$f^{(3)}(x) = e^x$$

⋮

$$f^{(n)}(x) = e^x \quad f^{(n)}(0) = 1$$

$$\sum \frac{f^{(n)}(0)}{n!} (x-0)^n$$

$$= \sum_{n=0}^{\infty} \frac{1 \cdot x^n}{n!}$$

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!} \quad \text{on } (-\infty, \infty) \quad \text{can be proven}$$

• Convergence is quickest close to a

Feb. 28

Taylor Series

$$T(x) = \sum \frac{f^{(n)}(a)}{n!} (x-a)^n$$

$$T^{(n)}(a) = f^{(n)}(a)$$

But it needs to be proven $T(x) = f(x)$

$$\text{ex. } g(x) = \begin{cases} e^{-1/x^2} & x \neq 0 \\ 0 & x = 0 \end{cases}$$

(maclaurin series generated by $g(x) = 0 \neq g(x)$)

Matches at $a=0$

i.e. radius of conv $R=0$

ex. Find the Maclaurin series generated by $\sin(x)$

$f^{(0)}$	$\frac{f^{(n)}(0)}{0}$
$\rightarrow f^{(0)} = \sin x$	0
$f^{(1)} = \cos x$	1
$f^{(2)} = -\sin x$	0
$f^{(3)} = -\cos x$	-1
$f^{(4)} = \sin x$	0

$$T(x) = 0 + \frac{1}{1!}x^1 + 0 - \frac{x^3}{3!} + 0 + \frac{x^5}{5!} + 0 - \frac{x^7}{7!} \dots$$

$$= x - \frac{x^3}{3!} + \frac{x^5}{5!} + \dots \quad \text{odd function: } -f(x) = f(-x)$$

$$= \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!}$$

ex. Find the interval of convergence

$$\text{We want } \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| < 1$$

$$\lim_{n \rightarrow \infty} \left| \frac{(-1)^{n+1} x^{2n+3}}{(2n+3)!} \cdot \frac{(2n+1)!}{(-1)^n x^{2n+1}} \right| < 1$$

$$= x^2 \lim_{n \rightarrow \infty} \frac{1}{(2n+3)(2n+2)} < 1$$

$$x^2 \cdot 0 < 1$$

$0 < 1 \checkmark$ for any value of x

\therefore series converges for $x \in \mathbb{R}$

ex. Can you guess the formula for $\cos(x)$

$$1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots$$

Result: $\cos(x) = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{(2n)!}$ on $(-\infty, \infty)$

Using Known Power Series to Evaluate Numerical Series

ex. Evaluate $\ln \sum_{n=2}^{\infty} \frac{1}{n!}$

$$(b) \sum_{n=0}^{\infty} \frac{(-1)^n 2^n}{n!}$$

$$(c) 1 \sim \frac{1}{2} + \frac{1}{2!} - \frac{1}{2 \cdot 2!} + \dots$$

$$(a) \sum_{n=0}^{\infty} \frac{1}{n!} = e^1$$

$$(b) \sum_{n=0}^{\infty} \frac{(-1)^n 2^n}{n!} = \sum_{n=0}^{\infty} \frac{(-2)^n}{n!} = e^{-2}$$

$$(c) \approx 1 - \frac{1}{2!} + \frac{1}{4!} - \frac{1}{6!} + \dots = \sum_{n=0}^{\infty} \frac{(-1)^n}{2n!} = \cos(1)$$

ex. Rewrite $e^{i\theta}$ where $i = \sqrt{-1}$

$$e^{i\theta} = \sum_{n=0}^{\infty} \frac{(i\theta)^n}{n!} = 1 + i\theta - \frac{\theta^2}{2!} - \frac{i\theta^3}{3!} + \frac{\theta^4}{4!} + \dots$$

→ exponential form
of a complex
number

$$= i \sin \theta + \cos \theta$$

ex. Find the Maclaurin series for $\sin(x^2)$

$$\sin(x^2) = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2(n+1)}}{2n!}$$

$$= \sum_{n=0}^{\infty} (-1)^n \frac{x^{4n+2}}{2n!}$$

$$\text{ex, } xe^x = x \sum_{n=0}^{\infty} \frac{x^n}{n!} = \sum_{n=0}^{\infty} \frac{x^{n+1}}{n!}$$

ex. Find the first 4 terms of the Maclaurin series for

$$(1) e^x \sin(x)$$

$$(2) \tan(x)$$

$$(1) e^x \sin x = \sum_{n=0}^{\infty} \frac{x^n}{n!} \cdot \sum_{n=0}^{\infty} (-1)^n \cdot \frac{x^{2n+1}}{(2n+1)!}$$

$$= \left(1 + \frac{x}{2!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} \right) \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \frac{x^7}{5040} + \dots \right)$$

$$= \underline{1} x + \underline{\frac{1}{2!} x^2} + \underline{-\frac{1}{6} + \frac{1}{2}} x^3 + \underline{-\frac{1}{3!} + \frac{1}{3!}} x^4 + \dots$$

$$(2) \tan x = \frac{\sin x}{\cos x}$$

$$1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots \overline{x + \frac{1}{3} x^3}$$
